HW1

2023-10-03

Question 1

```
# Delay = b0 + b1distance + b2departure delay + b3-8 day of week fixed effects
# Generate dummy variable for day fixed effects
air_df %<>% mutate(monday = if_else(day_of_week == 1, 1,0),
                 tuesday = if_else(day_of_week == 2, 1,0),
                 wednesday = if_else(day_of_week == 3, 1,0),
                 thursday = if_else(day_of_week == 4, 1,0),
                 friday = if_else(day_of_week == 5, 1,0),
                 saturday = if_else(day_of_week == 6, 1,0),
                 sunday = if_else(day_of_week == 17, 1,0)) %>%
  select(-day_of_week)
# First we'll make a matrix of the x values for ease of use
dependent_vars = air_df |> select(-c(arr_delay, sunday)) |> # We have to drop sunday because of multic
  mutate(constant = 1) |>
  select(constant, everything()) |> # Move the constant column to the start to match the output of lm
  as.matrix()
# Function that calculates sum of squared errors
sum_squares = function(beta){
 squared_error = (air_df\u00e4arr_delay - dependent_vars \u00c4*\u00b7 beta)^2
  sum_squares = sum(squared_error)
}
```

```
# We'll use the fminsearch from the pracma package which is equivilant to its matlab version to find th
ols = fminsearch(sum_squares, rep(0,9))
